29 April 2008
File No. 28882-629

TO: Mr. Robert Scott

FROM: Haley & Aldrich, Inc.

SUBJECT: Quarterly Report No. 25, First Quarter 2008 Full-Scale SVE System
Boeing Corporate Real Estate
Former C-6 Facility
Building 1/36 Area
Los Angeles, California

Haley & Aldrich, Inc. (Haley & Aldrich) has prepared this technical memorandum to summarize full-scale soil vapor extraction (SVE) activities conducted at the former Boeing Corporate Real Estate (CRE), C-6 Facility, Building 1/36 area (Site) located at the northwest corner of Normandie Avenue and Knox Street in the City of Los Angeles, California. The location of the Site is shown on Figure 1.

This technical memorandum has been prepared in response to Regional Water Quality Control Board, Los Angeles Region (LARWQCB) reporting requirements and presents the Site background followed by a discussion of SVE operations.

## BACKGROUND

Laboratory results for soil samples collected at the Site indicated the presence of volatile organic compounds (VOCs) at depth in certain areas of the site requiring remediation. SVE was recommended for the remediation of deep impacted soil (soil deeper than 12 feet below ground surface [bgs]). Haley & Aldrich was contracted by CRE to install and operate first an SVE pilot test system, and later a full-scale SVE system. Work plans for the SVE systems were submitted and approved by the LARWQCB in June 2001 and December 2001, respectively.

## SVE SYSTEM DESCRIPTION AND HISTORY

SVE pilot testing was conducted at the Site between July 2001 and March 2002. Full-scale SVE treatment of deep soils at the Site was started in May 2002. Full Scale treatment was temporarily stopped between June of 2002 and March 2003 for mechanical system

modifications and again between September 2004 and March 2006 to accommodate Site redevelopment.

The full-scale SVE system currently consists of 46 SVE well screens (17 dual- and 12 single-screened SVE wells), a trailer-mounted 1,000 standard cubic feet per minute (scfm) blower system, two 8,000-lb capacity granular activated carbon (GAC) vapor control vessels, a 10,000 lb capacity GAC vapor control vessel and associated piping. Two of the vapor control vessels are arranged in series (primary and secondary) to treat extracted vapors. The third GAC vessel is placed in use when the absorption capacity of GAC in the primary vapor control vessel is expended and the vessel is taken off-line.

## OPERATIONAL SUMMARY, FIRST QUARTER 2008

Operation and maintenance of the SVE system, monthly sample collection, weekly monitoring, and calculation of mass of VOCs removed, was conducted by Tait Environmental Management (TEM). TEM reported O&M activities on a weekly basis and provided monthly progress reports to CRE and Haley & Aldrich.

Operations for the first quarter 2008 covered the period of 1 January 2008 through 31 March 2008. The total mass of VOCs reported removed during SVE operations during the first quarter 2008 was approximately 25 pounds. Operational data for the full-scale SVE system is presented in Table 1.

Total hours of operation for the first quarter 2008 were approximately 1,147. Down time occurred due to failure of a thermocouple causing a quench of the GAC vessels, replacement of float switches in the GAC vessels, and mechanical failure of the SVE blower and electric motor. Percent up time based on all hours in the first quarter (2,184 hours; 1 January through 31 March 2008) is 53 percent and is presented on Graph 1. The system was operated in compliance with South Coast Air Quality Management District (SCAQMD) permit requirements during this quarter.

A system maintenance activity log is provided in Table 2 and a summary of additional operational data is presented below:

| | |
|---|---|
| Days of Operation | 48 (1,147 hours) |
| Available Days of Operation | 91 (2,184 hours) |
| Operational Time (%) | 53% |
| Estimated Mass Removed during Period | 25 pounds of VOCs reported as TNMOC |
| Cumulative Mass Removed (July 2001-March 2008): | 33,746 pounds of VOCs |

## OPERATIONS INFORMATION, FIRST QUARTER 2008

Key events that occurred during the quarter include:

| | | |
|---|---|---|
| ■ | 3 to 18 January 2008 | Failure of thermocouple caused system shut-downs. |
| ■ | 18 January 2008 | Failed thermocouple and float switches in GAC vessels replaced. |
| ■ | 18 to 25 February 2008 | SVE blower failure caused sporadic system shut-downs between 18 and 25 January. |
| ■ | 25 February 2008 | SVE blower replaced. |
| ■ | 17 March 2008 | SVE electric motor failed; system shut down. |
| ■ | 24 March 2008 | SVE electric motor replaced; system re-started. |

Well vapor concentrations of VOCs measured at the end of the first quarter 2008 are plotted on Figure 3. The well vapor concentration contours depicted on Figures 4A and 4B illustrate baseline start-up concentrations as well as remediation progress through 31 March 2008.

Well field concentrations of 2-butanone (MEK) were not measured during the first quarter 2008. The MEK vapor concentrations depicted on Figure 6 illustrate baseline MEK concentrations as well as decreasing concentrations through October 2007.

The cumulative mass removed by the full-scale SVE system is shown in Graph 2. Total VOC concentrations reported in grab samples collected from the undiluted influent of the SVE system during start-up and at the end of the quarter are plotted on Graph 3. Exothermic reactions were not observed in the GAC beds during the first quarter 2008.

## FIELD MEASUREMENTS, FIRST QUARTER 2008

In accordance with the SCAQMD permit requirements, flow rate and VOC concentration measurements were collected at the undiluted inlet, diluted inlet, between the GAC vessels, and at the exhaust stack. Flow rates were measured with a direct flow meter or by a hand-held Veloci-calc meter™. Additional measurements collected during operation included vacuum readings at each extraction well, at the system inlet, and at the GAC vessels and the blower exhaust temperature. The combined system influent VOC measurements are presented in Table 1. Field measurements of flow, VOC concentration, vacuum, and temperature were also collected at each well during the quarter. These measurements are provided in Table 3.

Individual SVE well flow rates this period ranged from approximately 5 to 154 scfm for a total undiluted flow rate from the wellfield of approximately 138 to 900 scfm. The system operated with inlet vacuums ranging from approximately 68 to 109 inches of water.

## VAPOR SAMPLING AND ANALYSIS, FIRST QUARTER 2008

For this period, nine vapor samples were collected from the process air stream (three from the undiluted inlet to primary GAC vessel, three from the effluent of the primary GAC vessel, and

three from the effluent from the secondary GAC vessel) and delivered to a state-certified laboratory for analysis. These samples were collected for SCAQMD permit compliance as well as system performance evaluation. The vapor samples were collected in Summa™ canisters provided by the analytical laboratory. Laboratory analyses were conducted on vapor grab samples using EPA Method TO-14. The laboratory results of the vapor samples from the system are summarized for detected compounds in Table 4.

Based on the results of the laboratory analysis of system vapor grab samples, maximum undiluted inlet VOC concentrations of speciated compounds in parts per billion by volume (ppbv) for the period are as follows:

| | |
|---|---|
| ■ 1,1,1-Trichloroethane (1,1,1-TCA) | 6,400 ppbv |
| ■ 2-Butanone (MEK) | 1,400 ppbv |
| ■ 1,1-Dichloroethene (1,1-DCE) | 1,200 ppbv |
| ■ Trichloroethene (TCE) | 970 ppbv |
| ■ Acetone | 140 ppbv |
| ■ Toluene | 110 ppbv |
| ■ Tetrachloroethene (PCE) | 21 ppbv |
| ■ 1,1,2-Trichloroethane (1,1,2-TCA) | 12 ppbv |
| ■ 1,1-Dichloroethane (1,1 -DCA) | 11 ppbv |
| ■ Chloroform | 10 ppbv |
| ■ cis-1,2-Dichloroethene (cis 1,2-DCE) | 6.9 J ppbv |
| ■ Xylenes (total) | 4.3 J ppbv |
| ■ o-Xylenes | 4.3 J ppbv |
| ■ Trichlorofluoromethane | 3.0 ppbv |
| ■ trans-1,2-Dichloroethene (trans-1,2 DCE) | 2.6 ppbv |
| ■ Methylene Chloride (MeCl) | 2.5 ppbv |
| ■ 1,2-Dichloroethane (1,2-DCA) | 1.3 J ppbv |
| ■ Dichlorodifluoromethane | 1.0 J ppbv |

J = Estimated value. Analyte detected above method detection limit, but below method reporting limit.

1,1,1-TCA was the VOC detected at the highest concentration in system influent samples collected during the first quarter 2008. Based on laboratory analytical data collected this quarter, the mass of VOCs, measured as total non-methane hydrocarbons was approximately 25 pounds, as shown on Graph 2. The average mass removal rates for this quarter are estimated to be approximately 0.3 lbs per day of operation.

## WELL FIELD SAMPLING AND ANALYSIS

No vapor samples were collected at the individual wells during the first quarter 2008. The laboratory analytical results of samples previously collected from individual wells are summarized in Table 5.

## ACTIVITIES FOR SECOND QUARTER 2008

Based on VOC concentration measurements and mass removal rates observed the first quarter 2008, SVE operations will continue during the second quarter 2008. This will include:

- Weekly monitoring of system parameters and well field VOC concentrations;
- Focusing SVE treatment on the portion of the well field near Well VEW-24B, to remove VOC mass from this location;
- Weekly sampling to assure compliance with SCAQMD permit conditions; and
- Evaluating the potential site closure after discussing with LARWQCB.

**Notes:**

ppbv = parts per billion by volume
ND = Not Detected at the laboratory reporting limit
MDL = Less than MDL (method detection limit)
NA = Not Analyzed
J = Estimated result. Result is less than reporting limit (RL)
**Bolded values are "B" flagged** = method blank contamination; the associated method blank contains the target analyte at a reportable level.
E = Estimated result. Result concentration exceeds the calibration range.
TPH-G = Results are indicative of compounds other than gasoline
MTBE analysis was omitted by the STL laboratory for the samples collected on August 3, 2006.
RL and MDL limits that are above AQMD limits are the lowest possible limits attained for that individual sample due to the high hits for the other target analytes present in the sample.

**Notes:**

ppbv = parts per billion by volume
ND = Not Detected at the laboratory reporting limit
MDL = Less than MDL (method detection limit)
NA = Not Analyzed
J = Estimated result. Result is less than reporting limit (RL)
**Bolded values** are "B" flagged = method blank contamination; the associated method blank contains the target analyte at a reportable level.
E = Estimated result. Result concentration exceeds the calibration range.
TPH-G = Results are indicative of compounds other than gasoline
MTBE analysis was omitted by the STL laboratory for the samples collected on August 3, 2006.
RL and MDL limits that are above AQMD limits are the lowest possible limits attained for that individual sample due to the high hits for the other target analytes present in the sample.
